

Information Systems and Reality

Manipulators of Information Fields

Information is everywhere, just the very simulation of the fabric of spacetime says many things about it. It is the reality itself that garners information, on basis that we develop our own upon its raw power. If reality itself is made up of conscious stuff, meaning information, then we can rely to suggest that whatever happens in it, governs our reality. In this perspective, and the well off perspectives of the rest, we can say that whoever governs information and the outcome of it through its philosophy can in an instance, control the world. But to prove this, what representation must we take to approve of this notion, that information is reality.

Notion 1:

$$I_{information} = \mathbb{R}^n$$

Information, if the property of real numbers upon all perspectives of dimensions suggests that all real operational applicability manifests, then, information, is the process for which all real numbers temporal or phenomenal, ultimately subdues. It is in this process of acquisition that the processes of reality manifests.

But if information is imaginary, and information is reality, there should be a property in it that suggests otherwise, that a great mind has processed this reality into simulation. That notion is notion 2 and

notion 2 states that, the aspects of which is real is a myriad of information field, called $I^n = \mathbb{C}^m$.

Notion 2:

$$I_{information}^n = \mathbb{C}^m$$

This suggests that information, and in all of its dimensionality has the superior and invariable dimensions of the complex systems and its phasors to suggest the aspects of reality. This suggests that simple ideas alone conjugate the meaning of reality. That the dimensions of information no matter how much we manipulate them, allows for the implications and applications of reality, through an aspect known as a variant of complex necessities, which are the m dimensions of complex numbers. Thus, upon the need for complex spaces, complex reality is necessitated by the complex equations of the imaginary theory. That we can validate and nullify a reality by the aspects of conscious experience through which information is processed through imaginative plays of existence.

But can we say that complex equities or energies of information, necessitate complex realities through an equalization of both? Rather than answering yes, we suggests that both information, upon witness by an observer, are both imaginary in aspect. But upon witness of an observer, rather than an equal sign, we can say that there is an exchange of this information field that suggests that reality is shifting through imaginative ways, and imaginative ways are developed

through conscious expression of reality and how it formulates new ideas base upon the observation of such a reality.

Thus we have:

$$\mathbb{R}^n \rightleftharpoons \mathbb{C}^m$$

Thus, we can confirm by this aspect, no matter the degree of differentiation through new meaning, no matter the dimensionality, that suggests that information is an identity of real and complex values of 1, yielding the result of existence such that:

$$I_{information} = I_{information}^n = 1 \text{ or } 0$$

This suggests an identity equation that we have a given state of 1 or 0. Suggesting equality leading to a whole state or a missing state. Two being the two states of inquiry when suggesting that information converges through or divergence through a source and a source code. Suggesting that it is on or off like that of a computer, suggests that information states such as the theory of convergences and divergences through source implies a connection “1” or a disconnection “0”. But in all essences, whether the equation suggests that two numbers are unequal, a state of disconnection or 0, or a state of equality of numbers, a state of connection 1, it can be suggested that information is just information, no matter what dimensionality it gives, it has an identity of 1, which connects as 1, or

disconnects as 0. It is the most important aspect of reality manipulation that we consciously implies, and suggests the logic that if the information equity or energy amasses, it is filled with the beauty and art of expressions leading to mathematical expressions of equations of logic, and geometrical expressions if the ideas need to be creative. Thus, leading to source, and it is the most fundamental, and well deserved aspect of information field and its convergence, and the aspects through which an information field manifests.
